

Supplemental Figure 1: Intermittent gestational heat exposure to 40°C during the second half of pregnancy led to high maternal mortality. (A) Percentage of dams that died during the exposure period.

Supplemental Figure 2: Heat exposure did not alter maternal hormone levels. A-F. Serum levels of corticosterone (A) aldosterone (B) testosterone (C) dihydrotestosterone (D) estradiol (E) or progesterone (F) in dams at E18.5. Each dot represents a single dam. Bar height represents the mean and error bars represent the SEM. Statistical significance was measured using an unpaired t-test. ns, not significant.

577 **Supplemental Figure 1:** Intermittent gestational heat exposure to 40°C during the
 578 second half of pregnancy led to high maternal mortality.

Supplemental Figure 2: Heat exposure did not alter maternal hormone levels.
